## Features

- Variable displacement axial piston pump of swashplate design for hydrostatic open circuit systems
- Flow is proportional to drive speed and displacement. It can be infinitely varied by adjustment of the swashplate.
- ISO mounting flange
- Flange connections to SAE metric
- 2 case drain ports
- Good suction characteristics
- Permissible continuous pressure 280 bar
- Low noise level
- Long service life
- Axial and radial loading of drive shaft possible
- High power-weight ratio
- Wide range of controls
- Short response times
- Through drive option for multi-circuit system
- Further information:  
Variable Displacement Pump A10VSO RE 92 712  
Size 18

## Technical Data

### Hydraulic fluid

For extensive information on the range of fluids and application conditions please see our data sheet RE 90220 (mineral oils), RE 90221 (environmentally acceptable fluids) and RE 90223 (HF-fire resistant hydraulic fluids).

When using HF- or environmentally acceptable hydraulic fluids possible limitations for the technical data have to be taken into consideration. If necessary please consult our technical department (please indicate type of the hydraulic fluid used for your application on the order sheet).

Operation on Skydrol hydraulic fluid is subject to consultation.

### Operating viscosity range

In order to obtain optimum efficiency and service life, we recommend that the operating viscosity (at operating temperature) be selected from within the range

$$v_{\text{opt}} = \text{operating viscosity } 16 \dots 36 \text{ mm}^2/\text{s}$$

referred to the reservoir temperature (open circuit).

### Viscosity limits

The limiting values for viscosity are as follows:

$$v_{\text{min}} = 10 \text{ mm}^2/\text{s}$$

short term at a max. permissible case temp. of 90° C.

$$v_{\text{max}} = 1000 \text{ mm}^2/\text{s}$$

short term on cold start.

### Temperature range (see selection diagram)

$$t_{\text{min}} = -25^\circ \text{ C}$$

$$t_{\text{max}} = 90^\circ \text{ C}$$

### Selection diagram

### Notes on the selection of the hydraulic fluid

In order to select the correct fluid, it is necessary to know the operating temperature in the tank (open loop) in relation to the ambient temperature.

The hydraulic fluid should be selected so that within the operating temperature range, the operating viscosity lies within the optimum range ( $v_{\text{opt}}$ ) (see shaded section of the selection diagram). We recommend that the higher viscosity range should be chosen in each case.

Example: At an ambient temperature of X° C the operating temperature is 60° C. Within the operating viscosity range ( $v_{\text{opt}}$ ; shaded area), this corresponds to viscosity ranges VG 46 or VG 68; VG 68 should be selected.

Important: The leakage oil (case drain oil) temperature is influenced by pressure and pump speed and is always higher than the tank temperature. However, at no point in the circuit may the temperature exceed 90° C.

If it is not possible to comply with the above conditions because of extreme operating parameters or high ambient temperatures please consult us.

### Filtration

The finer the filtration the better the cleanliness of the pressure fluid and the longer the life of the axial piston unit.

To ensure the functioning of the axial piston unit a minimum cleanliness level of:

9 to NAS 1638

18/15 to ISO/DIS 4406 is necessary.

If above mentioned grades cannot be maintained please consult supplier.

### High-speed-version

The size 140 is available in an optional high speed version. This version allows higher drive speeds at max. displacement (higher output flow) without affecting outside dimensions, see table on page 5.

### Mechanical displacement limiter

Mechanical displacement limiter **is possible on the nonthrough-drive model, N00 series** but **not** for the model **with through-drive**.

Exception: with FE1-, FE1D- and DFE1 control a max. displacement screw is not possible at all.

$V_{g \text{ max}}$  : for sizes 28 to 140  
Setting range  $V_{g \text{ max}}$  to 50%  $V_{g \text{ max}}$  stepless

$V_{g \text{ min}}$  : for sizes 100 and 140  
Setting range  $V_{g \text{ min}}$  to 50%  $V_{g \text{ max}}$  stepless

## Technical Data

(valid for operation on mineral oil; for **HF-fluids** see RE 90223 and **environmentally acceptable hydraulic fluids** see RE 90221)

### Operating pressure range - inlet

Absolute pressure at port S

$p_{abs \text{ min}}$  \_\_\_\_\_ 0,8 bar

$p_{abs \text{ max}}$  \_\_\_\_\_ 30 bar

### Operating pressure range - outlet

Pressure at port B

Nominal pressure  $p_N$  \_\_\_\_\_ 280 bar

Peak pressure  $p_{max}$  \_\_\_\_\_ 350 bar

(Pressure data to DIN 24312)

Applications with intermittent operating pressures up to 315 bar at 10% duty are permissible.

Limitation of pump output pressure spikes is possible with relief valve blocks mounted directly on flange connection, acc. to data sheets RE 25 880 and RE 25 890 to be ordered separately.

### Case drain pressure

Maximum permissible pressure of leakage fluid (at port L,  $L_1$ ):

Maximum 0,5 bar higher than the inlet pressure at port S, but no higher than 2 bar absolute.

### Direction of through flow

S to B.

### Determination of inlet pressure $p_{abs}$ at suction port S or reduction of displacement for increasing speed.

**Table of values** (theoretical values, without taking into account  $\eta_{mh}$  and  $\eta_v$ : values rounded off)

Size			28	45	71	100	140/High-S*	
Displacement	$V_{g \text{ max}}$	cm <sup>3</sup>	28	45	71	100	140/140	
Max. speed <sup>1)</sup>	at $V_{g \text{ max}}$	$n_{o \text{ max}}$	rpm	3000	2600	2200	2000	1800/2050
Max. permitted speed (limit speed) with increased input pressure $p_{abs}$ bzw. $V_g < V_{g \text{ max}}$		$n_{o \text{ max}}$	rpm	3600	3100	2600	2400	2100/2200
Max. flow	at $n_{o \text{ max}}$	$q_{vo \text{ max}}$	L/min	84	117	156	200	252/287
	at $n_E = 1500 \text{ min}^{-1}$		L/min	42	68	107	150	210
Max. power ( $\Delta p = 280 \text{ bar}$ )	at $n_{o \text{ max}}$	$P_{o \text{ max}}$	kW	39	55	73	93	118/134
	at $n_E = 1500 \text{ min}^{-1}$		kW	20	32	50	70	98
Max. torque ( $\Delta p = 280 \text{ bar}$ )	at $V_{g \text{ max}}$	$T_{\text{max}}$	Nm	125	200	316	445	623
Torque ( $\Delta p = 100 \text{ bar}$ )	at $V_{g \text{ max}}$	$T$	Nm	45	72	113	159	223
Moment of inertia about drive axis		$J$	kgm <sup>2</sup>	0,0017	0,0033	0,0083	0,0167	0,0242
Case volume			L	0,7	1,0	1,6	2,2	3,0
Weight (without fluid)		$m$	kg	15	21	33	45	60
Permissible loading of drive shaft:	max. axial force	$F_{ax \text{ max}}$	N	1000	1500	2400	4000	4800
Max. permissible radial force <sup>2)</sup>		$F_{q \text{ max}}$	N	1200	1500	1900	2300	2800

\* = High-Speed-Version

<sup>1)</sup> These values are valid for an absolute pressure of 1 bar at the suction port S. By reducing the displacement or increasing the input pressure the speed can be increased as shown in the diagram.

<sup>2)</sup> Please consult us for higher radial forces.

### Determination of displacement

Flow  $q_v = \frac{V_g \cdot n \cdot \eta_v}{1000}$  [L/min]

Torque  $T = \frac{1,59 \cdot V_g \cdot \Delta p}{100 \cdot \eta_{mh}} = \frac{V_g \cdot \Delta p}{20 \cdot \pi \cdot \eta_{mh}}$  [Nm]

Power  $P = \frac{T \cdot n}{9549} = \frac{2 \pi \cdot T \cdot n}{60 \cdot 1000} = \frac{q_v \cdot \Delta p}{600 \cdot \eta_t}$  [kW]

$V_g$  = displacement [cm<sup>3</sup>] per revolution

$\Delta p$  = pressure differential [bar]

$n$  = speed [rpm]

$\eta_v$  = volumetric efficiency

$\eta_{mh}$  = mechanical-hydraulic efficiency

$\eta_t$  = overall efficiency ( $\eta_t = \eta_v \cdot \eta_{mh}$ )

application of forces

## Installation Notes

Optional installation position. The pump housing must be filled with fluid during commissioning and remain full when operating.

In order to attain the lowest noise level, all connections (suction, pressure, case drain ports) must be linked by flexible couplings to tank.

Avoid placing a check valve in the case drain line.

This may, however, be permissible in individual cases, after consultation with us.

### 1. Vertical installation (shaft end upwards)

The following installation conditions must be taken into account:

#### 1.1. Arrangement in the reservoir

Before installation fill pump housing, keeping it in a horizontal position.

a) If the minimum fluid level is equal to or above the pump mounting face close port "L" plugged, leave ports "L<sub>1</sub>" and "S" open; L<sub>1</sub> piped and recommendation S piped (see Fig.1).

b) If the minimum fluid level is below the pump mounting face pipe port "L<sub>1</sub>" and "S" according to Fig. 2.

Close port "L" with respect taking into consideration conditions in 1.2.1.

Fig. 1

#### 1.2. Arrangement outside the reservoir

Before installation fill the pump housing, keeping it in a horizontal position. For mounting above reservoir see Fig. 2.

Limiting condition:

1.2.1. Minimum pump inlet pressure  $p_{abs\ min} = 0.8\ bar$  under both static and dynamic conditions.

Note: Avoid mounting above reservoir wherever possible in order to achieve a low noise level.

The permissible suction height  $h$  comes from the overall pressure loss, but may not be bigger than  $h_{max} = 800\ mm$  (immersion depth  $h_{t\ min} = 200\ mm$ ).

Fig. 2

Overall pressure loss  $\Delta p_{tot} = \Delta p_1 + \Delta p_2 + \Delta p_3 \leq (1 - p_{abs\ min}) = 0.2\ bar$

$\Delta p_1$ : Pressure loss in pipe due to accelerating column of fluid

$$\Delta p_1 = \frac{\rho \cdot l \cdot dv}{dt} \cdot 10^{-5} \text{ (bar)}$$

$\rho$  = density (kg/m<sup>3</sup>)  
 $l$  = pipe length (m)  
 $dv/dt$  = rate of change in fluid velocity (m/s<sup>2</sup>)

$\Delta p_2$ : Pressure loss due to static head

$$\Delta p_2 = h \cdot \rho \cdot g \cdot 10^{-5} \text{ (bar)}$$

$h$  = height (m)  
 $\rho$  = density (kg/m<sup>3</sup>)  
 $g$  = gravity = 9.81 m/s<sup>2</sup>

$\Delta p_3$ : Line losses (elbows etc.)

### 2. Horizontal installation

The pump must be installed, so that "L" or "L<sub>1</sub>" is at the top.

#### 2.1. Arrangement in the reservoir

a) If the minimum fluid level is above the top of the pump, port "L<sub>1</sub>" closed, "L" and "S" should remain open, L piped and recommendation S piped (see Fig. 3)

b) If the minimum fluid level is equal to or below the top of the pump, pipe ports "L" and possibly "S" as Fig. 4.; close port "L<sub>1</sub>". The conditions according to item 1.2.1.

Fig. 3

#### 2.2. Installation outside the reservoir

Fill the pump housing before commissioning.

Pipe ports "S" and the higher port "L" or "L<sub>1</sub>".

a) When mounting above the reservoir, see Fig. 4.

Conditions according to 1.2.1.

Fig. 4

b) Mounting below the reservoir

Pipe ports "L<sub>1</sub>" and "S" according to Fig.5, close port "L".

Fig. 5

## Performance Curves for Pump with Pressure Control DR

### Noise level

Measured in an anechoic chamber

Distance from microphone to pump = 1 m

## DG 2-position adjustment, direct control

Before finishing your design, please request a certified drawing.

The pump can be set to a minimum swivel angle by connecting an external switching pressure to port X.

This pressure acts directly onto the control piston, a min. control pressure of at least 30 bar is required.

The pump can only be switched between  $V_{gmax}$  and  $V_{gmin}$ .

The switching pressure  $p_{St}$  depends on pump output pressure at a ratio of 1:4

$$p_{St} = \frac{p}{4}$$

switching pressure  $p_{St}$  in X = 0 bar

$$\triangleq V_{gmax}$$

switching pressure  $p_{St}$  in X  $\geq$  30 bar

or  $\frac{p}{4} \triangleq V_{gmin}$

### Controller data

min. switching pressure	30 bar
max. switching pressure	280 bar

### Unit dimensions

Sizes 28...100

Size 140

- S** Suction port
- L, L1** Case drain ports (L1 plugged)
- X** Pilot pressure port (plugged)

## DR Pressure Control

The pressure controller serves to maintain a constant pressure in a hydraulic system within the control range of the pump. The pump therefore supplies only the amount of hydraulic fluid required by the system. Pressure may be steplessly set at the control valve.

### Static operating curve

(at  $n_1 = 1500 \text{ rpm}$ ;  $t_{oil} = 50^\circ \text{ C}$ )

### Dynamic operating curves

The operating curves are mean values measured under test conditions with the unit mounted inside the tank.

Conditions:  $n = 1500 \text{ rpm}$   
 $t_{oil} = 50^\circ \text{ C}$   
 Main relief set at 350 bar

Load steps were obtained by suddenly opening and closing the pressure line with a pressure relief valve as load valve 1 m from the output flange of the pump.

### Ports

- B** Pressure port
- S** Suction port
- L, L1** Case drain ports ( L1 plugged)

### Controller data

Hysteresis and repetitive accuracy  $\Delta p$  \_\_\_\_\_ max. 3 bar

Max. Pressure rise

71	106	160
100	106	165
140	127	169

# DRG Pressure Controller, Remote Control

Function and equipment as for DR.

A pressure relief valve can be connected to port X for remote control applications; this is not included in the items supplied with the DRG control.

The standard pressure differential setting at the control valve is 20 bar. A pilot oil flow of approx. 1,5 L/min is then used. If an other setting (range 10-22 bar) is required please indicate in clear text.

We recommend the following as separate pressure relief valves:

DBDH 6 (hydraulic) to RE 25402 or

DBETR -SO 381 with orifice  $\varnothing 0,8$  in P (electric) to RE 29166.

The max. pipe length should not exceed 2m.

### Static Operating Curve

(at  $n_1 = 1500$  rpm;  $t_{oil} = 50^\circ C$ )

### Controller data

Hysteresis  $\Delta p$  \_\_\_\_\_ max. 3 bar

Max. pressure rise \_\_\_\_\_

Size	28	45	71	100	140
$\Delta p$ bar	4	6	8	10	12

Pilot oil requirement \_\_\_\_\_ approx. 4,5 L/min

Flow loss at  $q_{v\ max}$  see pages 8 and 9.

## DFR/DFR1 Pressure / Flow Control

In addition to the pressure control function, the pump flow may be varied by means of a differential pressure over an orifice or valvespool, installed in the service line. The pump flow is equal to the actual required flow by the actuator.

The DFR1-valve has no connection between X and the tank.

For function of pressure control see pages 16/17.

### Static operating curve

(at  $n_1 = 1500 \text{ rpm}$ ;  $t_{oil} = 50^\circ \text{ C}$ )

### Static operating curve at variable speed

### Dynamic flow control operating curve

The operating curves are average values measured under test conditions with the unit mounted inside the tank.

NG	$t_{SA}$ [ms] stand by-280 bar	$t_{SE}$ [ms] 280 bar-stand by	$t_{SE}$ [ms] 50 bar-stand by
28	40	20	40
45	50	25	50
71	60	30	60
100	120	60	120
140	130	60	130

#### Ports

- B** Pressure port
- S** Suction port
- L, L1** Case drain ports ( L1 plugged)
- X** Pilot pressure port

#### Differential pressure $\Delta p$ :

Adjustable between 10 and 22 bar (higher values on request).

Standard setting: 14 bar. If a different setting is required please indicate in clear text.

When port X is unloaded to tank a "zerostroke pressure" of  $p = 18 \pm 2 \text{ bar}$  ("stand by") results (dependent on  $\Delta p$ ).

#### Controller data

Data pressure controller see page 16.

Max. flow variation (hysteresis and increase) measured at drive speed  $n = 1500 \text{ rpm}$

Size	28	45	71	100	140	
$\Delta q_{vmax}$	L/min	1,0	1,8	2,8	4,0	6,0

DFR pilot oil consumption \_\_\_\_\_ max. approx. 3 ... 4,5 L/min

DFR1 pilot oil consumption \_\_\_\_\_ max. approx. 3 L/min

Flow loss at  $q_{vmax}$  see page 8 and 9.

## Unit Dimensions DFR; DFR1 Pressure and Flow Control

Before finishing your design, please request a certified drawing.

### Sizes 28...100

# DFLR Pressure / Flow / Power Control

In order to achieve a constant drive torque with a varying operating pressure, the swivel angle and with it the output flow of the axial piston pump is varied so that the product of flow and pressure remains constant.

Constant flow control is possible below the power curve.

## Static operating curve

- Ports**
- B** Pressure port
  - S** Suction port
  - L, L1** Case drain ports ( L1 plugged)
  - X** Pilot pressure port

The power curve is set at the factory, please state your requirements in clear text e.g. 20 kW at 1500 rpm.

## Controller data

Technical data constant pressure control see page 16.

Technical data flow control see page 20.

Start of control \_\_\_\_\_ from 80 bar

Pilot oil requirement \_\_\_\_\_ max. approx. 5,5 L/min

Flow loss at  $q_{vmax}$  see pages 8 and 9.

## Unit Dimensions Pressure / Flow / Power Control DFLR

Before finishing your design, please request a certified drawing.

### Sizes 28...100

## FHD Pilot Pressure Dependent Flow Control with Pressure Cut-off

The swivel angle of the pump and therefore its displacement is dependent on the pilot pressure  $p_{StX}$  present in port X.

A constant pressure of  $p_y = 35$  bar must be applied to port Y. The integral pressure control is steplessly adjustable.

(Please state set value required in clear text).

### Controller data

Hysteresis  $\pm 2\%$  of  $V_{g\ max}$

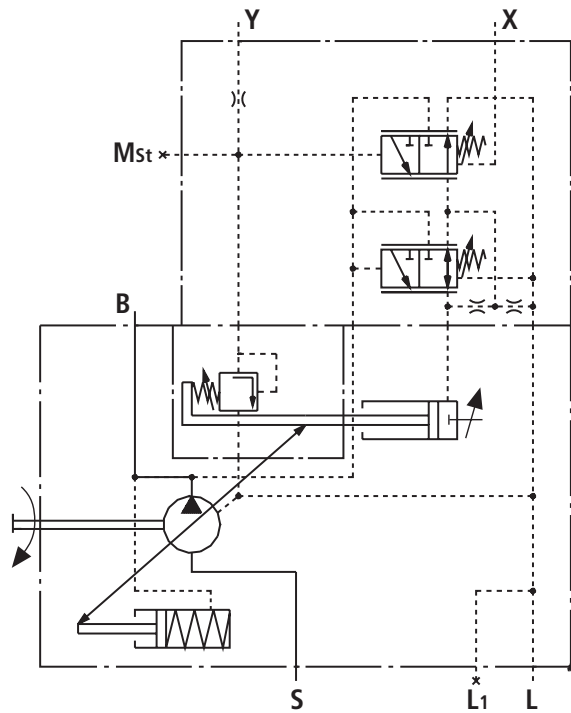

External pilot oil consumption in Y \_\_\_\_\_ max. approx. 3 ... 4,5 L/min

Pressure rise  $\Delta p$  \_\_\_\_\_ max. 4 bar

Flow loss at  $q_{v\ max}$  see pages 8 and 9.

### Ports

- B** Pressure port
- S** Suction port
- L, L1** Case drain port ( L1 plugged)
- X, Y** Pilot pressure ports
- MSt** Test port

### Static curve

(at  $n_1 = 1500$  rpm;  $t_{oil} = 50^\circ C$ )

## Unit Dimensions FHD Pilot Pressure Dependent Flow Control with Pressure Cut-off

## Through drive

The A10VSO pump can be supplied with through drive in accordance with the type code on page 3.

The through drive version is designated by the code numbers (KB2–K57).

If no other pumps are fitted by the manufacturer, the simple type designation is sufficient.

in this case, the delivery package comprises:

Hub, fixing screws, seal and, if necessary, an adaptor flange.

### Combination pump

By building on further pumps it is possible to obtain independent circuits:

1. If the combination pump consists of **2 A10VSO** and if these are to be **supplied assembled** then the two order codes should be linked by means of a „+“ sign.

Ordering example:

A10VSO 71 DR/31 L–PPA12KB3 +  
A10VSO 28 DR/31 L–PSA12N00

2. If a **gear or radial piston pump** is to be built on at the factory, please consult us.

### Permissible moment of inertia

m<sub>1</sub>, m<sub>2</sub>, m<sub>3</sub> [kg] Pump mass

l<sub>1</sub>, l<sub>2</sub>, l<sub>3</sub> [mm] Distance to center of gravity

$$T_m = (m_1 \cdot l_1 + m_2 \cdot l_2 + m_3 \cdot l_3) \cdot \frac{1}{102} \text{ [Nm]}$$

Size		28	45	71	100	140
Permissible moment of inertia T <sub>m</sub>	Nm	880	1370	2160	3000	4500
Permissible moment of inertia T <sub>m</sub>	Nm	88	137	216	300	450
at dynamic mass acceleration 10g ≅ 98.1 m/sec <sup>2</sup>						
Mass	m <sub>1</sub> kg	15	21	33	45	60
To center of gravity	l <sub>1</sub> mm	110	130	150	160	160

### Maximum permissible input and through drive torque

The split in torque between pump 1 and 2 is optional. The max. permissible input torque T<sub>tot</sub> as well as the max. permissible through-drive torque T<sub>D</sub> may not be exceeded.

Size		28	45	71	100	140
Max. permissible input torque at pump 1 with shaft "P"						
	T <sub>tot</sub> Nm	137	200	439	857	1206
Max. permissible through-drive torque						
	T <sub>D</sub> Nm	137	200	439	778	1206
	T <sub>D keyed shaft</sub> Nm	112	179	283	398	557

Size		28	45	71	100	140
Max. permissible input torque at pump 1 with shaft "S"						
	T <sub>tot</sub> Nm	198	319	626	1104	1620
Max. permissible through-drive torque						
	T <sub>D</sub> Nm	160	319	492	778	1266
	T <sub>D keyed shaft</sub> Nm	112	179	283	398	557

Size		28	45	71	100	140
Max. permissible input torque at pump 1 with shaft "R"						
	T <sub>tot</sub> Nm	225	400	644	–	–
Max. permissible through-drive torque						
	T <sub>D</sub> Nm	176	365	548	–	–
	T <sub>D keyed shaft</sub> Nm	112	179	283	–	–

T<sub>tot</sub> = Max. permissible input torque at pump 1

T<sub>D</sub> = Max. permissible through-drive torque at through-drive to splined shaft

T<sub>D keyed shaft</sub> = Max. permissible through-drive torque at through-drive to keyed shaft
